

Integration with other ENS

Metis Secure's powerful front end software provides integration with other emergency notification systems.

Outdoor speakers

The same voice messages activated on Metis alerting devices indoors can be blasted over outdoor speakers.

Integration at the software level coordinates indoor and outdoor information.

Cell/text & email

Metis software can be integrated with 3rd party services like e2Campus, to send cell calls, text messages and emails.

When a Call for Help is made from a Metis device, a text message can be sent automatically to campus security or other emergency personnel.

Digital signage

LED signs, built with Metis' wireless technology inside, are part of the Metis system.

Metis can also talk to existing digital signs. Metis front end software routes messages to the existing interface for digital signage.

Conference calling

Metis has the ability to initiate a dial out to a calling bridge activating a live conference call of key team members.

Team members will be automatically called and connected to a live conference call, reducing critical decision making time.

Fire alarms

The Metis system has been designed to address new NFPA regulations regarding mass notification systems.

The front end software can be integrated with fire panel operations to coordinate fire and mass notification systems.

Surveillance cameras

A Call for Help can automatically tell camera monitoring software to select and display the camera where the request for help was initiated.

This provides a real time visual observation of an event site at the earliest stage.
