

Emergency Notification and High-Tech Manufacturing

After a near miss from a tornado in 2010, UTC Aerospace in Tullahoma, Tennessee contacted Metis Secure Solutions looking for a state-of-the-art emergency notification system at the plant. The Metis Secure system gives UTC Aerospace a precision warning system that can be customized to the facility and the work environment.

The system allows the plant safety directors to do three important things:

- Notify the plant about emergency situations outside, such as tornados
- Notify teams in the plant about internal situations
- Activate a call for help from strategic locations

By creating programmed messages for events like tornados, the Metis Secure system saves time and provides detailed instructions. At UTC Aerospace, a tornado warning is a Code Black warning. This instantly identifies the threat to the staff. The message also tells employees where to seek shelter. This helps minimize downtime in the plant by keeping people informed.

Metis Secure also created a set of special messages, designed to notify the staff about injuries and other urgent medical situations at the Tullahoma plant. Employees assigned to medical response teams can be alerted throughout the plant and can quickly respond to the situation. UTC Aerospace now has a next generation notification system that allows them to send emergency warnings to specific locations in seconds.
